# DATE: 13.03.2025

The dangerous illusion cast by development rankings

# The Cost of Development and Environmental Degradation

- The recent wildfires in California led to significant economic losses, estimated at around \$250 billion, which is comparable to Greece's GDP in 2023.
- These catastrophic events underscore the hidden costs associated with the development models of affluent nations. The financial costs of environmental disasters often outweigh the perceived benefits of development.

#### Unsustainable Resource Consumption

- If all countries consumed resources in a manner similar to the United States or the European Union, the Earth would need multiple planets to sustain such lifestyles.
- Despite these concerns, global benchmarks like the United Nations' Human Development Index (HDI) continue to portray these nations as models of development.
- This contradiction between the HDI rankings, which focus on human well-being, and the ecological toll of such consumption, is misleading. It promotes an unsustainable development model that fails to account for the environmental impact of such lifestyles.

#### Flaws in the HDI Model

- The HDI, which ranks nations based on life expectancy, education, and income, fails to consider the environmental impact of these nations' development models.
- Countries that top the HDI rankings are also among the largest consumers of resources and emitters of carbon.
- If the entire world were to adopt these high-consumption models, it would lead to severe ecological collapse.
- Wealthy nations have already surpassed several planetary boundaries, such as excessive greenhouse gas emissions and widespread ecological destruction.
- The HDI, by ignoring these critical factors, encourages an unsustainable path of progress that disproportionately benefits a few and harms the planet.

#### Planetary Pressures-adjusted HDI (PHDI) and Its Limitations

• To address criticisms, the UN introduced the Planetary Pressures-adjusted HDI (PHDI) in 2020, which lowers HDI scores for nations with high environmental impacts.

MAKING YOU SERVE THE NATION

PL RAJ IAS & IPS ACADEMY

- However, the PHDI still compares nations relative to one another rather than against absolute ecological limits.
- High-income nations continue to score well on the PHDI, not because they are environmentally sustainable, but because other nations have even worse environmental records.
- This approach perpetuates the illusion of progress while allowing environmental degradation to continue unchecked.

## The Need to Focus on Middle-Income Countries

- Some middle-income nations have managed to achieve decent living standards while maintaining a relatively low ecological footprint.
- Costa Rica, for example, has achieved high life expectancy, universal healthcare, and widespread literacy through investments in renewable energy and forest conservation.
- Sri Lanka, with an HDI of 0.78, has made significant strides in education and healthcare, although it faces ongoing challenges like economic instability, inflation, and political unrest.
- These examples highlight that it is possible to achieve human well-being while maintaining environmental sustainability. However, these successes are not without their challenges and require careful balance.

#### India's Path Forward

- The development models of affluent nations are not suitable for a country like India, with its population of 1.4 billion people. Adopting these models would lead to severe ecological consequences.
- India needs to explore alternative development models that promote both human well-being and environmental sustainability, drawing lessons from countries that balance economic growth with ecological responsibility.
- Progress should be measured not just by GDP growth or HDI rankings, but by ensuring that every citizen can live with dignity within the Earth's ecological limits.
- This approach is not only a moral imperative but also a necessary strategy for the long-term survival and prosperity of nations in the 21st century.

These points emphasize the urgent need to rethink the traditional metrics of development and to consider sustainability as a core component of any development strategy, especially for densely populated and emerging economies like India.
